

Spam Message Classifier

Detect Spam or Not Spam with Machine Learning

Python

Pandas

Streamlit

Work & Ownership

Area of Work	Contributions
Project Setup	Created folder structure
Vectorization	Converted text to numbers
Frontend UI	Built Streamlit app
Testing	Checked prediction results
Bug Fixing	Fixed errors and improved output
Prediction	Displayed Spam / Not Spam result

Challenges & Decisions

Challenges

- Difficulty in converting text messages into machine-readable format
- Confusion in choosing the correct ML model for spam prediction

Decisions

- Used CountVectorizer / TF-IDF for text vectorization
- Chose Logistic Regression because it gave better accuracy and simple implementation

Learning s

- Learned how Machine Learning models classify spam messages
- Understood text vectorization using CountVectorizer / TF-IDF
- Learned dataset preprocessing and cleaning techniques
- Improved debugging and testing skills during model training
- Learned how to build and deploy a simple app using Streamlit

Reflection & Next Steps

Reflection

- Started testing the model step-by-step instead of debugging at the end
- Improved project organization and file management
- Focused more on understanding the ML workflow clearly

Next Steps

- Improve model accuracy using better algorithms
- Add more features and a better UI to the Streamlit app
- Practice more ML projects for better understanding
